Report findings: 82% of finance professionals say their admin workload contributes to stress

Our new report, *The Financial Services Documentation Burden*, offers a snapshot of the documentation and administration workload finance professionals face today. Following the pandemic, more employers are focusing on the wellbeing of their employees, finding new tools to support them in their everyday roles. As the documentation burden continues to rise for finance professionals, it'll be a critical starting point for employers looking to relieve stress and drive productivity among their teams. Here are three insights on the pressure faced by financial services professionals, and some of the opportunities that lie ahead.

Ed McGuigan

Posted 3 December 2021

In our recent survey of 100 financial services professionals, 82% told us their admin workload has contributed to the stress they experience at work.

Documentation and admin workload is far from a new challenge for financial services—it's a critical part of every professional's role. But after a year and a half of major changes across the industry, including new ways of working and shifting employee attitudes towards work/life balance, the documentation burden is becoming more of a pressing issue for many financial services organisations.

Critically, employers will need to start addressing the burden on their employees if they're to retain their top performers, create supportive workplaces, and continue delivering standout services to their clients.

Our survey explored the true impact of documentation burden on the financial services industry and which objectives organisations are prioritising for 2022. You can see the results in our new report, [The Financial Services Documentation Burden](#), and discover some of the ways you can relieve the pressure on your employees. Or, read on as we share some of the key findings below.

1. Documentation burdens continue to grow

Nearly three quarters of the financial services professionals surveyed told us they often struggle with the amount of documentation their role requires.

Of course, in many roles, documentation and admin tasks are inescapable. When asked how they spend their time typing, admin and documentation tasks take up four of the top five answers—with 53% saying customer/client communications and internal correspondence, 50% saying filling in forms, and 37% saying report writing.

None of these responsibilities will be going away any time soon. Instead, they're only growing—and as the documentation burden continues to scale, employers will still need to find a way to support their employees and help them complete these tasks more efficiently.

2. Financial services professionals are reaching their limit

Looking closer at how much time is spent on these daily tasks revealed that the average financial services professional spends a huge seven hours and 55 minutes typing every day. And to add to the time behind the keyboard, 64% spend at least another hour typing for personal reasons once their day ends.

It's surprising to see such a long time typing across the respondents, especially considering most think of themselves as fast or above-average typists. But despite their typing skills, 53% still agreed that their typing speed ultimately makes documentation tasks more difficult and time-consuming to complete.

As documentation workloads continue to rise, strong typing skills will only get finance professionals so far. They'll still face a backlog of typing tasks that leaves little time away from the keyboard in the working day, which ultimately means less time spent face-to-face with clients and colleagues. This can quickly lead to detrimental impacts on client relationships and affect overall employee satisfaction.

3. Speech technology offers a solution

Implementing new technologies is a top-three priority among respondents, alongside productivity and improving client and customer service. The results suggest that organisations are willing to adapt and embrace new tools if it improves their operations. But the critical

challenge will be finding the right tools to genuinely support financial services professionals in their roles.

More than 70% of respondents agree that [innovative technology such as speech recognition](#) would help their organisation differentiate itself and compete with disruptors more effectively. And promisingly, two fifths of financial services organisations we surveyed are already using voice-based technologies.

It was great to see a familiarity with speech recognition, but there was still some hesitation among respondents to fully embrace it in the working day. 67% say speech recognition tools they've encountered struggle to recognise the specialist terms they use at work, and many said a lack of accuracy prevented them from using speech technology.

To put any concerns to rest, and help finance professionals relieve their documentation burden, employers should choose speech technology that's tailored to financial services—and offers the enterprise-grade capabilities professionals need to succeed.
