Research reveals clinicians spend a third of working hours on clinical documentation

Dr. Simon Wallace | Chief Clinical Information Officer (CCIO), Nuance Healthcare UK and Ireland

18 November 2022

Nuance commissioned an independent research consultancy to study the challenges of clinical documentation for NHS trusts in England. Almost 1,000 doctors, nurses and allied health professionals participated in the survey which ran between April and July 2022. The results of this survey have now been published in a report, revealing healthcare professionals are spending an average of 13.5 hours per week generating clinical documentation, a 25% increase in the last 7 years.

Back in 2015, Nuance published a study with independent research consultancy, [Ignetica](#), revealing the challenges of clinical documentation. Now, seven years on, we have repeated a very similar study with Ignetica assessing the burden of clinical documentation. It has revealed many of the documentation challenges clinicians face remain the same, and in some cases have worsened over the last 7 years.

This year's study is based on an extensive survey of 966 NHS healthcare professionals from four acute trusts and one mental health and community trust. There was very good representation for Doctors, Nurses, and Allied Health Professionals (AHPs) – the three target groups.

Here are some of the key takeaways.

Clinicians are spending more time on documentation

Healthcare professionals across all roles spend a significant proportion of their working week adding to, or creating, clinical documentation. An average of 13.5 hours per week—which is more than a third of the average clinician's working hours, and 25% more time than in 2015. Consultant nurses reported the highest number of hours spent on documentation per week, at 16.5 hours, and consultant doctors followed close behind at 15.1 hours.

Another area of concern, revealed by this study, is that much of this documentation is completed outside of working hours. Healthcare professionals across all roles report spending an average of 3.2 hours per week generating clinical documentation in their personal time—with consultant doctors reporting an average of 4.7 hours.

As overload and burnout levels continue to rise among clinician teams, it's crucial that healthcare leaders search for ways to reduce documentation tasks from eating into their clinician's personal time. [A separate survey conducted by Nuance in 2020](#) found that 85% of NHS healthcare professionals think the burden of clinical documentation is a significant contributor to burnout.

Putting down the pen and paper

One positive development is that documentation modalities have dramatically changed in the past seven years. In this year's report, half the number of clinicians reported using pen and paper compared to those surveyed in 2015.

This switch has also brought a reduction in narrative content in clinical documentation. As more clinicians shift to using an electronic patient record (EPR) to complete their documentation, notes are becoming more structured.

Inaccuracies are still causing challenges

Surprisingly, despite the switch from pen and paper to digital platforms, the survey did not reveal a significant increase in documentation accuracy. In fact, in a quarter (25%) of instances, clinicians report the information they need isn't available in the records at the right time—only a 2% fall in the past seven years.

Like the 2015 study, the number one cause for this challenge is incomplete information in the clinical notes/records. In contrast, issues relating to diagnostics (such as waiting for diagnostics results or uncertainty in what diagnostics have been requested) appear to have significantly worsened over the last 7 years.

These challenges add to the time clinicians need to spend wrestling with documentation throughout the day. In this year's survey, despite an increase in digitisation, clinicians' time spent searching for information remained very high, rising from 55 minutes to 62 minutes per day.

Every hour a clinician spends on creating or locating clinical documentation is one less hour spent on patient care. To enable them to get back to doing what they trained for, we must find new ways to help ease the growing burden of administrative responsibilities.

A more efficient way to tackle clinical documentation

Nearly all the challenges studied in the report highlight just how much time documentation takes up in clinicians' working week—whether it's creating it, amending incomplete documentation, or searching for information.

As workloads continue to grow and healthcare organisations are forced to operate with more limited resources, we're at risk of putting one of our most precious institutions under even more avoidable pressure. In response, many healthcare leaders are exploring how [speech-enabling their EPR](#) can help their clinicians tackle documentation more efficiently and free up time in the working day.

About Dr. Simon Wallace

Dr. Simon Wallace is the Chief Clinical Information Officer (CCIO) of Nuance's Healthcare division in the UK and Ireland. Simon has worked as a GP, hospital and public health doctor in Brighton and London. His interest in health informatics began in the 90s when he spent a year at the King's Fund investigating the impact of the internet on shared decision making between patients and their healthcare professional. For the past 15 years, he has worked for a range of organisations including Bupa, Dr Foster, Cerner Corporation and GSK across a range of technologies which include electronic patient records, telemedicine, mobile health and lifestyle devices. Simon has a keen interest in the voluntary sector, recently completing a 7 year term as a Trustee for Fitzrovia Youth in Action, a children and young people's charity based in London.
